

Case Study

Tempus Sales Copilot

Tempus Sales Representatives manage large territories with hundreds of clinics and hospital systems. To be effective, they need to know which doctors are seeing patients that would benefit most from Tempus's specific genomic panels.

Currently, reps spend hours digging through Salesforce notes, market volume data, and recent clinical publications to prepare for a single 15-minute meeting with a Chief Medical Officer (CMO) or an Oncologist.

The Problem

There is a "data-to-insight" gap. We have the data (testing volumes, new drug approvals), but the sales reps don't have a way to quickly synthesize this into a "Why Tempus, Why Now?" pitch for a specific prospect.

The Challenge

Build a prototype of an Tempus Sales Copilot.

The prototype should ingest three mock data sources:

- Market Intelligence (CSV): Lists of oncologists, providers, likely size of patient population
 - You can grab real data for this, or create a mock dataset
- Product Knowledge Base (Markdown/PDF): Tempus's latest test capabilities
 - Pull data from Tempus's website
- CRM Notes (Text): Notes from previous interactions with a specific hospital (e.g., "Dr. Smith is concerned about turnaround time").
 - Create a mock dataset for 5-10 physicians

The Tool should output:

- Ranked provider list: A list of providers to call, ordered by impact
- The "Objection Handler": A drafted response to a known concern (like turnaround time) using real performance metrics from the knowledge base.

- The "Meeting Script": A 30-second "elevator pitch" tailored to that specific doctor's interests.

Instructions

Deliverables:

- A slide deck (shared Google Slides presentation, or PDF export) of to 8 slides describing your solution and approach
- A simple prototype of your solution. Provide instructions on how to access your prototype.
- (Optional) A short video (2-3 min) demoing your solution

Tools

To standardize the assessment of all case studies, we require the use of free tooling only to develop your solution.

Evaluation Criteria:

Your slides and prototype should articulate or demonstrate:

- Problem definition. What aspect of the problem are you solving and why?
Process. The process you went through to develop your solution (how you arrived at your solution, the tools you used to develop it)
- Assumptions you're making in your solution

Some of the criteria we'll use to assess:

- Clarity and depth of problem understanding
- Creativity and quality of product design thinking
- Clarity of communication
- Demonstrated fluency with GenAI tools
- Technical depth
